

Compressor adapters

We sell two adapters, 50-023 without bleeder hole and 50-0231 with bleeder hole. The reason we sell the bleeder hole type is that a lot of non-Badger compressor can not start under load (which means that if compressor is off but air pressure is in the airline compressor will not turn). The compressor will not run and only hum then will eventually burn up. This bleeder hole will eliminate the back pressure which will allow compressor to start under no load. Please note however when purchasing these non-Badger bleeder type compressors will result in lower top end air pressures because more air is being used while airbrushing.
